Working Prototype Known Problems Report

Sugar Analysis

CSE 115A Sugar Analysis Team:

Nooran Salim, Nikita Thumma, Pranav Nampoothiri, Justin Morales, Nicole Ng

- The notification takes time to appear in the dropdown menu (delayed by a few seconds)
- Notifications pop up if time for a future day is earlier than the current time, which it shouldn't; this happens soon after the setting of the time for any of the labels.
- Notifications don't show up when the application is closed, only when on the application and when the application is running in the background.
- When you log after a week, you will override the value in the progress chart for that day but the rest of the days will remain the same unless you update throughout the week
- Alignment is off on Nexus phone, activity_extra.xml also does not load on Nexus
- When you add the blood sugar for an event and click the open button, it fills in immediately--but when you go to another tab and return to the main, the button returns to its 'open' form again
- Settings for the user's personal information does not check for illegitimate input, and can lead to poor input in the database.
- Personal Information page does not properly set information to the settings page, as a result, height and weight are not saved into the database
- If you click on "Sugar Analysis" when you're on the home page, it redirects to the personal information page
- More than one input per time of day does not display the average correctly on the bar chart
